

How to replace missing tools in PSP

In the latest versions of PSP, Corel has deleted many of the tools from the toolbar and menus as they've included new ones. It is easy to repair this issue. Since I usually return my favs to the toolbar, one of the first I return is the deform tool. I will use that as my example, however, any tool can be accomplished the same way.

In the menu choose View, scroll down and choose Customize. When the window opens up it will usually be open with the Commands tab chosen, but if not choose that tab. It will look like this:

In the box labeled Categories, scroll down until you can click on All Commands. In the other box named Commands scroll down until you find your tool, in this case I'm choosing Deform. Once you've selected your tool, with your mouse left-click and hold it bringing it in drag-and-drop style to the toolbar in the place that you want it to be located.

As you can see by this screen shot, I've put the deform tool on my left toolbar and it is instantly ready to be used.

Voila - you're done!
